

• Depending on condn., $\text{new_left} = \frac{\text{left} + \text{right}}{2} + 1$ or,

$$\text{new_right} = \frac{\text{left} + \text{right}}{2} - 1.$$

• Now, $\text{new_left} > \text{old_right}$ iff $\frac{\text{left} + \text{right}}{2} = \text{right}$, or $\text{left} = \text{right}$

• Similarly, $\text{new_right} < \text{old_left}$ iff $\text{left} = \text{right}$.

• \therefore We already know $\text{searchnum} \notin \text{list}[0 \dots \text{left}-1]$ and $\notin \text{list}[\text{left}+1 \dots n-1]$

• Since, we have moved to the next iteration, it means $\text{searchnum} \neq \text{list}[\text{left}]$

So, $\text{searchnum} \notin \text{list}[0 \dots n-1]$, and the loop terminates and returns -1, as it should. \square

Exercises-1.5

1.) a) Is $n=2$ the largest value of n for which there exist +ve integers x, y and z such that $x^n + y^n = z^n$ has a solution?

b) Store 5 divided by 0 into x and go to statement 10.

Both fail to satisfy one of the five criteria of an algorithm. Which criterion do they violate

Soln: b) What is statement 10? Not specified. Ambiguous instruction.

a) ~~It~~ Violates finiteness (since we don't know how many triples of x, y, z we need to check effectively) and it also violates effectiveness; the instructions can't be computed manually.

2) Horner's rule is a strategy for evaluating a polynomial $A(x) = a_n x^n + a_{n-1} x^{n-1} + \dots + a_1 x + a_0$ at point x_0 using a minimum no. of multiplications. This rule is: $A(x_0) = (\dots ((a_n x_0 + a_{n-1}) x_0 + \dots + a_1) x_0 + a_0)$

Write a C program to evaluate a polynomial using Horner's rule.

$$2x^2 + 3x + 12 = (2x + 3)x + 12$$
